

AI for media, art, and design

Course overview, 2024

Prof. Perttu Hämäläinen

Aalto University

AI = artificial intelligence
ML = machine learning

First, some basic course info

Teachers

- Perttu Hämäläinen, https://twitter.com/perttu_h
- Nam Hee Gordon Kim, <https://twitter.com/NamHeeGordonKim>
(tutoring projects on animation, motion control and advanced machine learning)
- Adas Slezas: will give a talk about his M.Sc. on interactive virtual dance partners in VR/XR, can tutor students utilizing Motion Matching

Materials

- Github: <https://github.com/PerttuHamalainen/MediaAI/README.md>,
- Twitter: <https://twitter.com/aaltomediaai>

Structure

- Most of the time dedicated to personal projects and exercises
- Days often start with short lectures

Links to lecture slides and exercises:

<https://github.com/PerttuHamalainen/MediaAI>

Slides currently 2 years outdated, will be updated as we progress

Learning goals

- Understand how common AI algorithms & tools work
- Understand what the tools can be used for in media, art & design
- Get hands-on practice of using, applying, and/or designing such tools

Passing the course

- Project work, either solo or in pairs or small groups
- Main goal: Demonstrate learning & progress in relation to your individual starting points
- During the first day(s), I'll talk to everyone comment/approve the project

Passing the course

- Submit a report of the project to get the credits, via MyCourses
- Deadline April 1st
- Include:
 - Names of the students in the team
 - What was each student's starting knowledge
 - What did you create: 1 page text + images, link to video if possible
 - How did it work out / what were the results
 - What each student learned

Four levels of mastery

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

Four levels of mastery

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

Anyone

Four levels of mastery

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

Anyone with some programming skills

Four levels of mastery

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

Everyone with basic knowledge of Python, what kinds of data various modules take in and output, and how one can *backpropagate* through a network of modules

Artificer example: StyleCLIPDraw

Text Prompt

“A man is
watching TV” +

Style Image

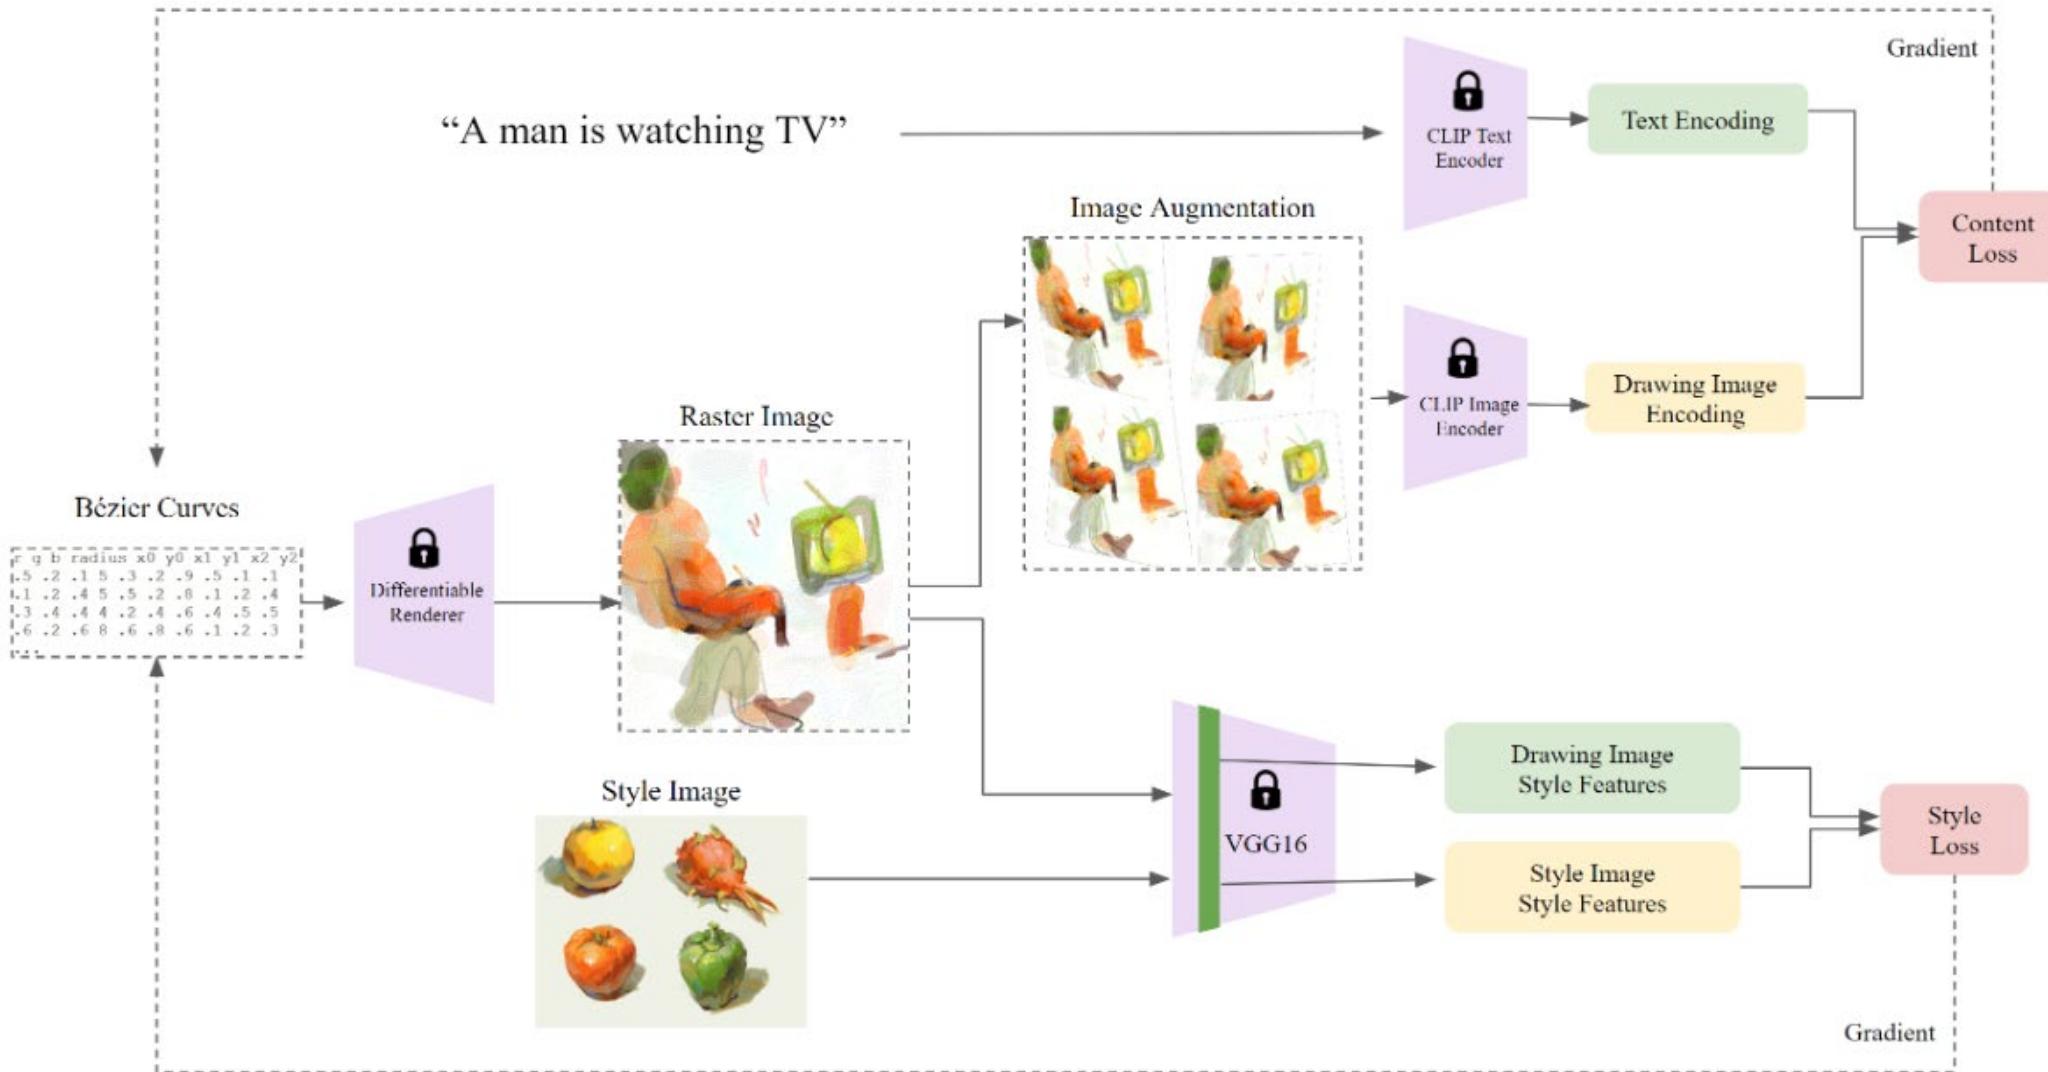

StyleCLIPDraw

Try it in your browser:

https://colab.research.google.com/github/pschaldenbrand/StyleCLIPDraw/blob/master/Style_ClipDraw.ipynb

Novel and interesting results without building or training any custom models, simply by combining existing CLIP & VGG16 models with a differentiable renderer.

Four levels of mastery

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

Advanced computer science & math studies: Linear algebra, optimization, statistics, rigorous software engineering...

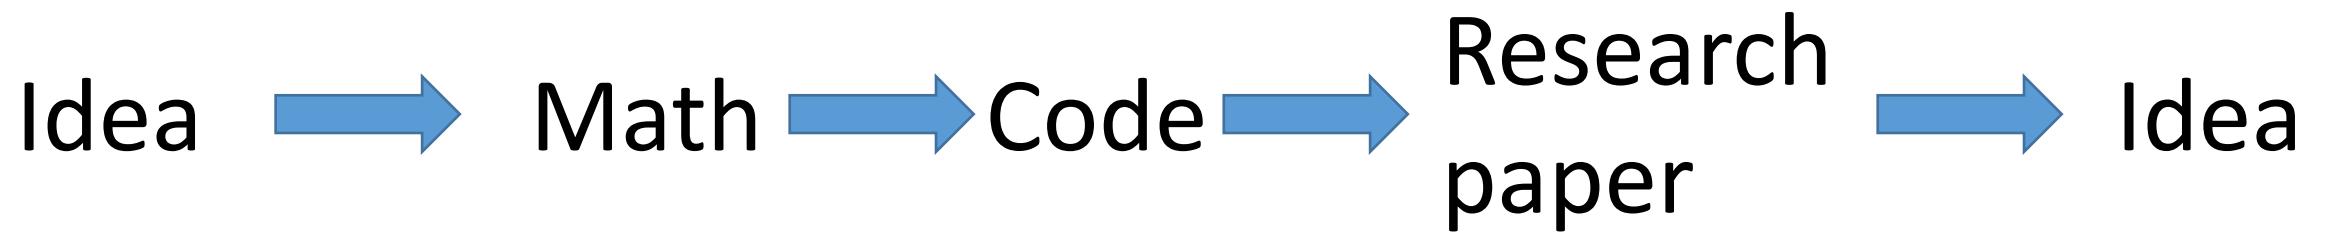

Four levels of mastery

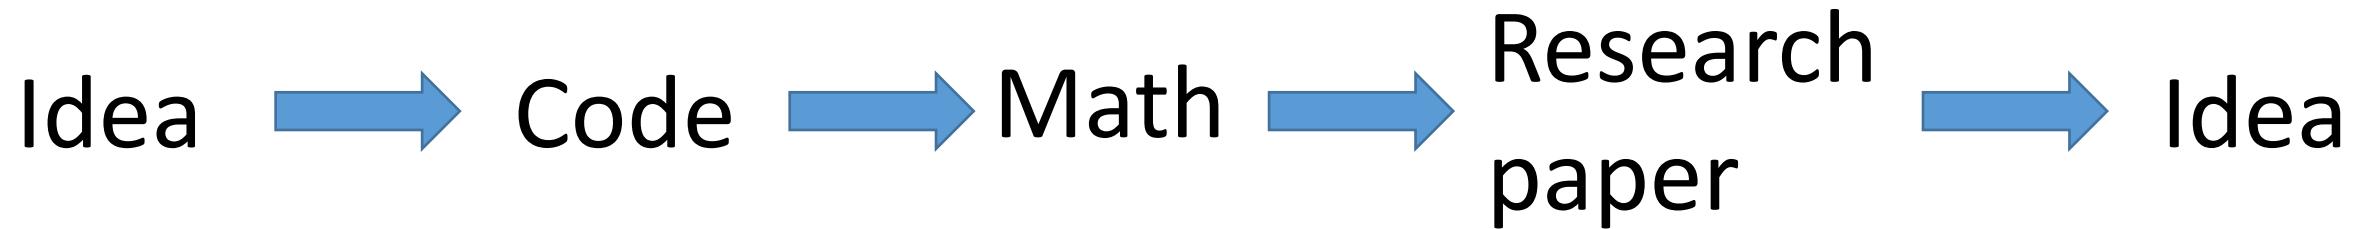

1. Artist: Create using existing tools such as ChatGPT, DALL-E, Midjourney
2. Tinkerer:
 1. Run existing AI&ML Python code, e.g., in Google Colab
 2. Build your own apps or experiments using AI & ML APIs such as OpenAI API or AWS Bedrock
 3. Understand and adjust parameters and options, collect and process your own data (e.g., scrape and analyze Reddit conversations, create game ideas by scraping top-rated Steam game descriptions and feeding them as examples to OpenAI API, finetune Stable Diffusion with your own images)
3. Artificer: Construct novel systems by combining existing AI & ML modules in new ways.
4. Alchemist: Design and build AI & ML algorithms and models from scratch

This course is primarily designed for levels 1-3.
Ideally, we'd like to see at least some of you level up.

Pedagogical approach of the course

- The slides and talks have minimal math, focus on visualizations and hands-on practice
- Everything in Github: Lecture slides, exercises, extra material

Kill Math

Bret Victor / April 11, 2011

The power to understand and predict the quantities of the world should not be restricted to those with a freakish knack for manipulating abstract symbols.

When most people speak of Math, what they have in mind is more its mechanism than its essence. This "Math" consists of assigning meaning to a set of symbols, blindly shuffling around these symbols according to arcane rules, and then interpreting a meaning from the shuffled result. The process is not unlike casting lots.

This mechanism of math evolved for a reason: it was the most efficient means of modeling quantitative systems given the constraints of pencil and paper. Unfortunately, most people are not comfortable with bundling up meaning into abstract symbols and making them dance. Thus, the power of math beyond arithmetic is generally reserved for a clergy of scientists and engineers (many of whom struggle with symbolic abstractions more than they'll actually admit).

We are no longer constrained by pencil and paper. The symbolic shuffle should no longer be taken for granted as the fundamental mechanism for understanding quantity and change. Math needs a new

Alan Kay: *Doing With Images Makes Symbols*

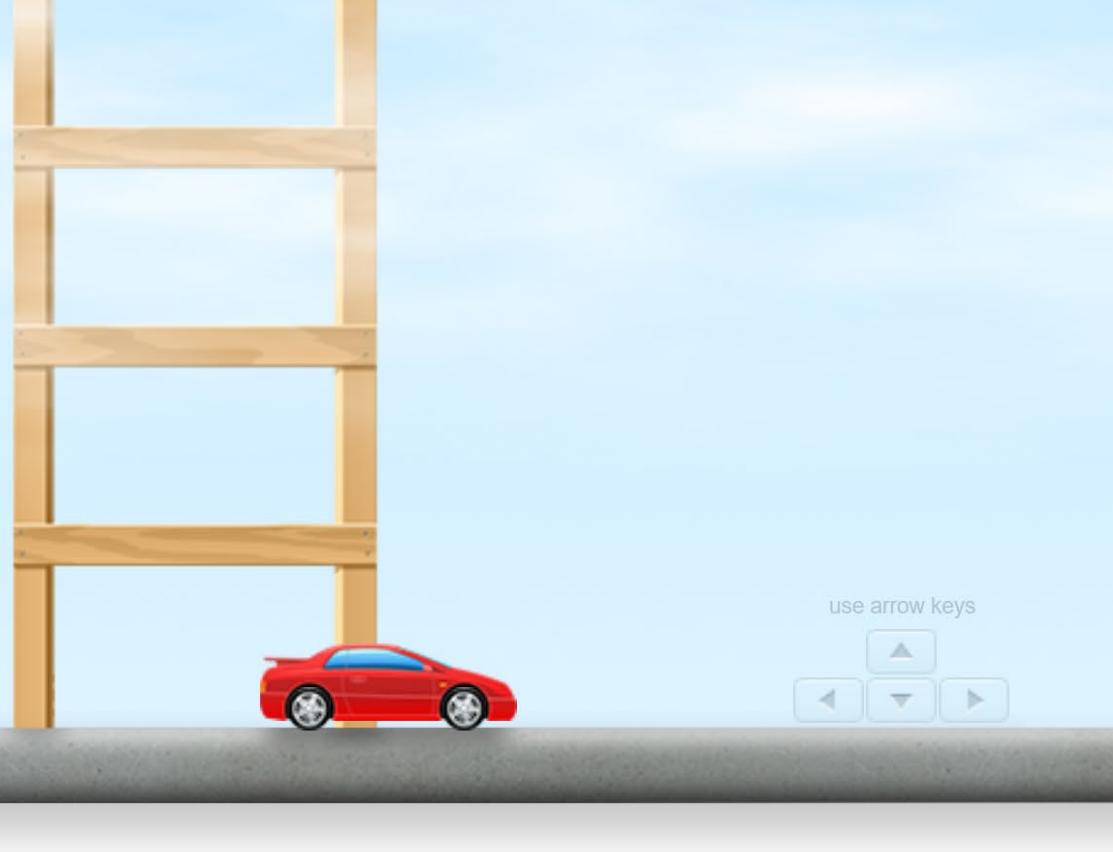

Jacques Hadamard, the famous French mathematician, in the late stages of his life, decided to poll his 99 buddies, who made up together the 100 great mathematicians and physicists on the earth, and he asked them, "How do you do your thing?" They were all personal friends of his, so they wrote back depositions. Only a few, out of the hundred, claimed to use mathematical symbology at all. Quite a surprise. All of them said they did it mostly in imagery or figurative terms. An amazing 30% or so, including Einstein, were down here in the mudpies [doing]. Einstein's deposition said, "I have sensations of a kinesthetic or muscular type." Einstein could feel the abstract spaces he was dealing with, in the muscles of his arms and his fingers...

The sad part of [the doing -> images -> symbols] diagram is that every child in the United States is taught math and physics through this [symbolic] channel. The channel that almost no adult creative mathematician or physicist uses to do it... They use this channel to communicate, but not to do their thing. Much of our education is founded on those principles, that just because we can talk about something, there is a naive belief that we can teach through talking and listening.

Up and Down the Ladder of Abstraction

A Systematic Approach to Interactive Visualization

Bret Victor / October, 2011

"In science, if you know what you are doing, you should not be doing it. In engineering, if you do not know what you are doing, you should not be doing it. Of course, you seldom, if ever, see either pure state."

—Richard Hamming, *The Art of Doing Science and Engineering*

How can we design systems when we don't know what we're doing?

The most exciting engineering challenges lie on the **boundary of theory and the unknown**. Not so unknown that they're hopeless, but not enough theory to predict the results of our decisions. Systems at this boundary often rely on *emergent behavior* — high-level effects that arise

How do we explore? If you move to a new city, you might learn the territory by walking around. Or you might peruse a map. But far more effective than either is *both together* — a street-level experience with higher-level guidance.

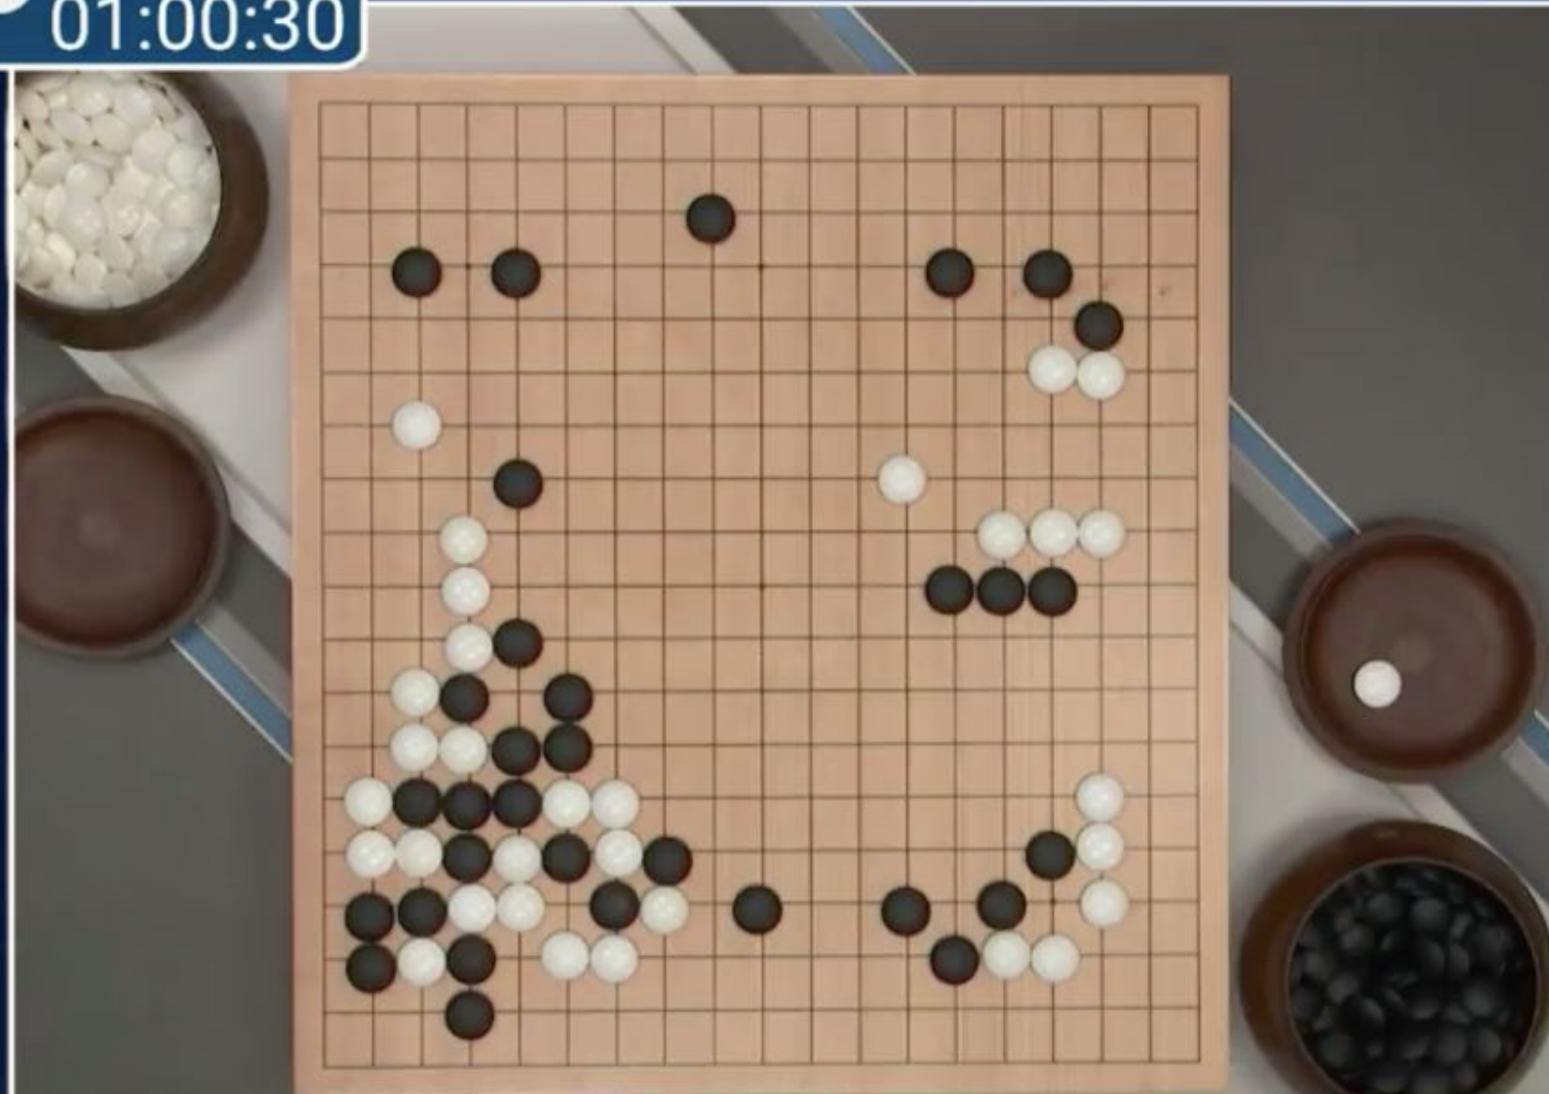

Likewise, the most powerful way to gain insight into a system is by *moving between levels of abstraction*. Many designers do this instinctively. But it's easy to get stuck on the ground, experiencing concrete systems with no higher-level view. It's also easy to get stuck in the clouds, working entirely with abstract equations or aggregate statistics.

This interactive essay presents the **ladder of abstraction**, a technique for

In fine art, especially painting, humans have mastered the skill to create unique visual experiences through composing a complex interplay between the content and style of an image. Thus far the algorithmic basis of this process is unknown and there exists no artificial system with similar capabilities. However, in other key areas of visual perception such as object and face recognition near-human performance was recently demonstrated by a class of biologically inspired vision models called Deep Neural Networks.^{1,2} Here we introduce an artificial system based on a Deep Neural Network that creates artistic images

AI and media

- Media creation (content design, with or without human assistance)
- Media adaptation (e.g., style transfer, adapting a game to support player needs and motivations)
- Media use (testing, collaboration & competing with humans, e.g., using game playing agents)
- User modeling: biomechanical, perceptual, emotion, experience (models of users yield predictions and estimates of human behavior and experience, which enables and informs all of the above)

An Experiment in Automatic Game Design

Julian Togelius and Jürgen Schmidhuber

Abstract—This paper presents a first attempt at evolving the rules for a game. In contrast to almost every other paper that applies computational intelligence techniques to games, we are not generating behaviours, strategies or environments for any particular game; we are starting without a game and generating the game itself. We explain the rationale for doing this and survey the theories of entertainment and curiosity that underly our fitness function, and present the details of a simple proof-of-concept experiment.

Keywords: game design, evolutionary design, entertainment metrics

I. INTRODUCTION

Can computational intelligence (CI) help designing games? One is tempted to answer “Yes, obviously, the whole field of Computational Intelligence in Games (CIG) is devoted to this, isn’t it?”

However, the majority of CIG research is concerned with learning to play particular games as well as possible. There

interest from game developers in learning to play the game better *per se*.

Now, there is certainly other research being carried out in the CIG field that is more directly relevant to real game development (and often dependent on research done in learning to play games, which thus becomes indirectly relevant to game development). For example, we have CI techniques proposed to generate NPC controllers that play interestingly as opposed to just well [1], [2]; CI techniques for automatically finding exploits/bugs in games [3]; CI techniques for modelling the behaviour of human players[4], [5]; CI techniques for making NPCs trainable by human players [6]; and techniques for generating the content of a game, such as tracks, levels or mazes [4], [7].

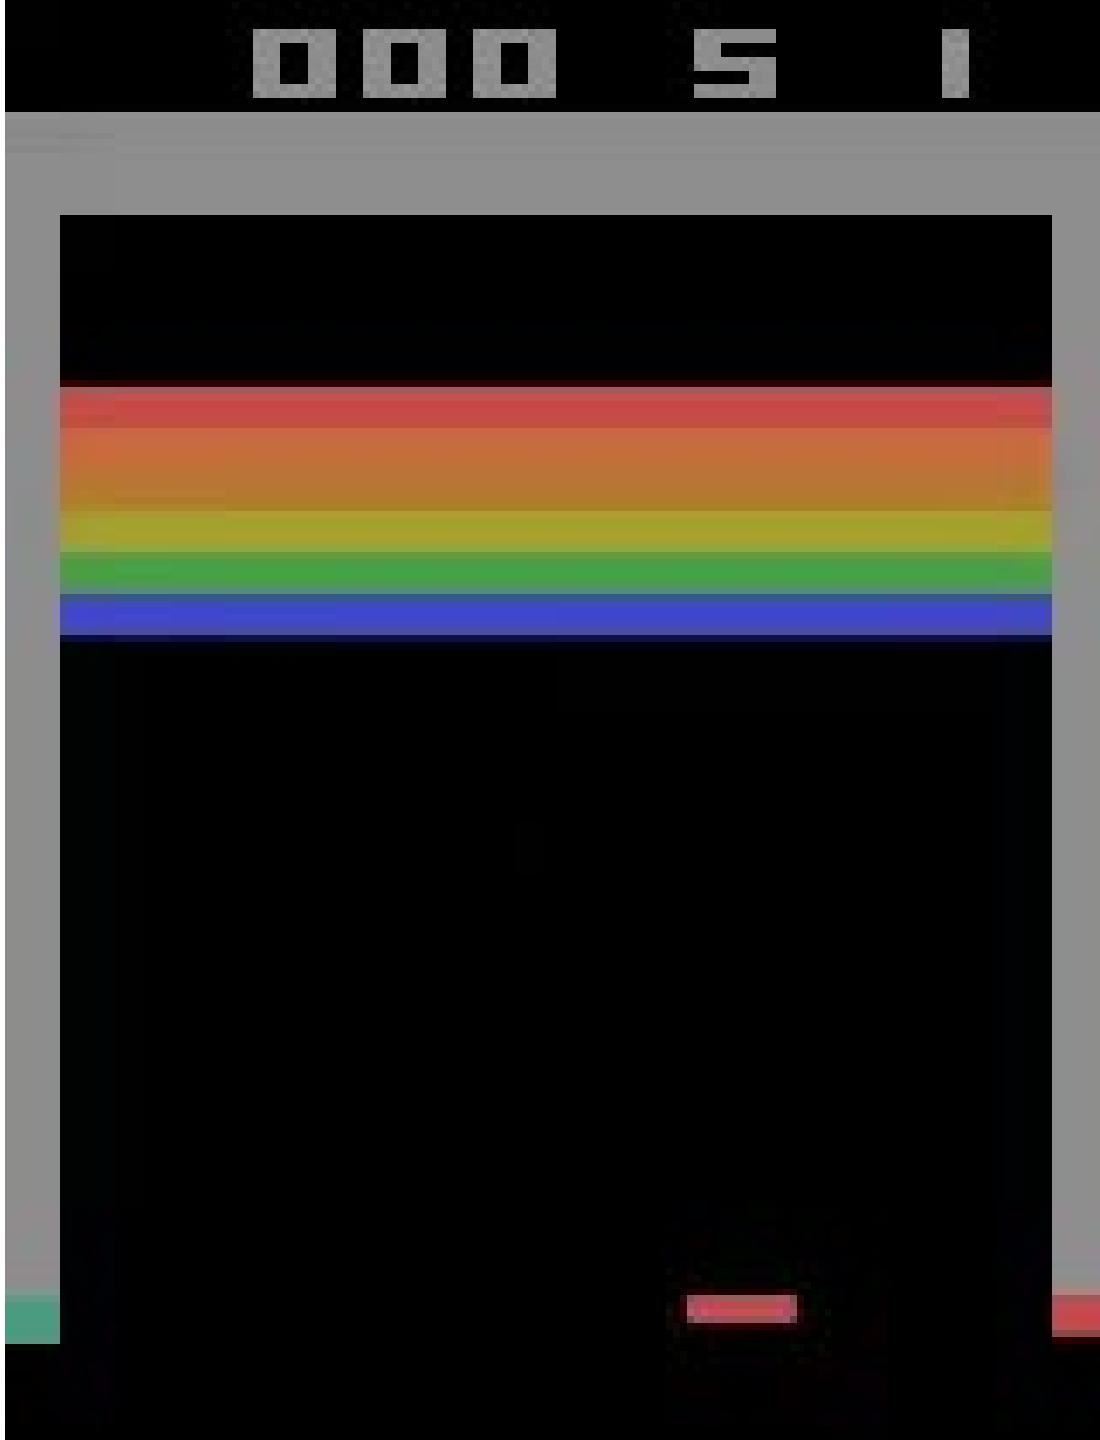

While the above techniques all represent relevant research directions for game design, they all assume that there is a game there to begin with. Before we let CI loose on

Predicting Game Difficulty and Churn ~~without~~ At Players

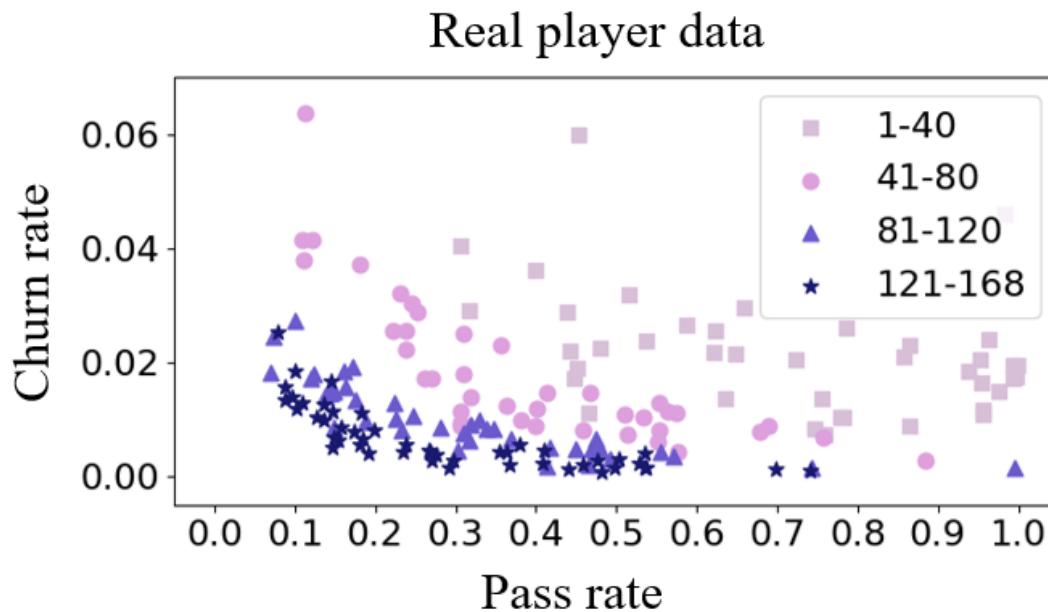

Dataset: 95k players,
168 game levels

Shaghayegh Roohi^{2,1}, Asko Relas¹, Jari Takatalo¹, Henri Heiskanen¹, Perttu Hämäläinen²

1) Rovio Entertainment, 2) Aalto University

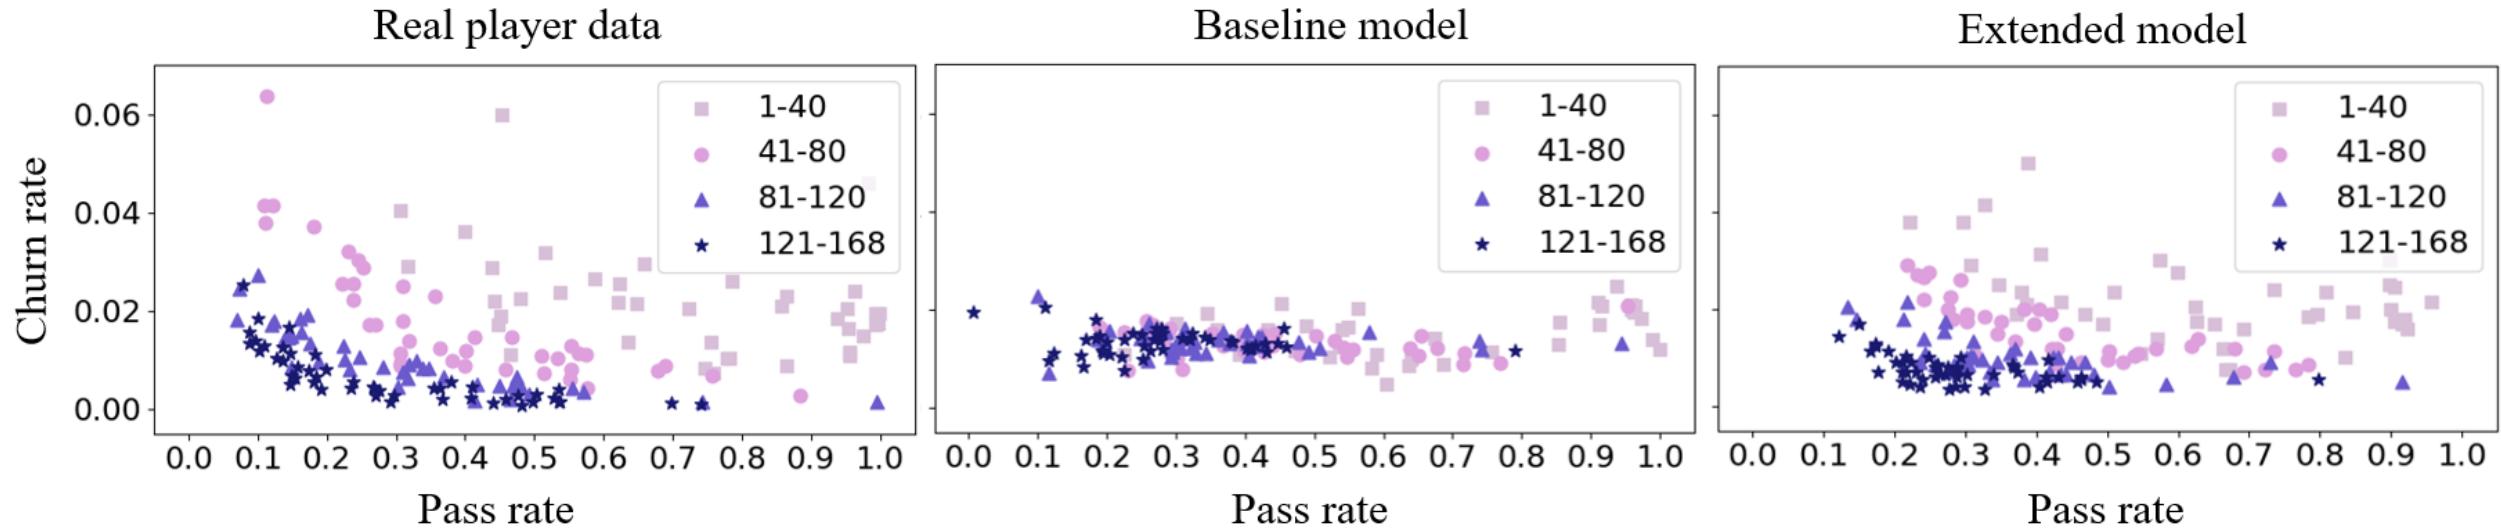

Problem: predict observed player data using simulation

- Data: Pass and churn rates of 168 Angry Birds Dream Blast levels, 95k players
- Pass rate: 1 divided by how many tries a level requires, on average
- Churn rate: probability of a player not returning to the game after the level for 7 days

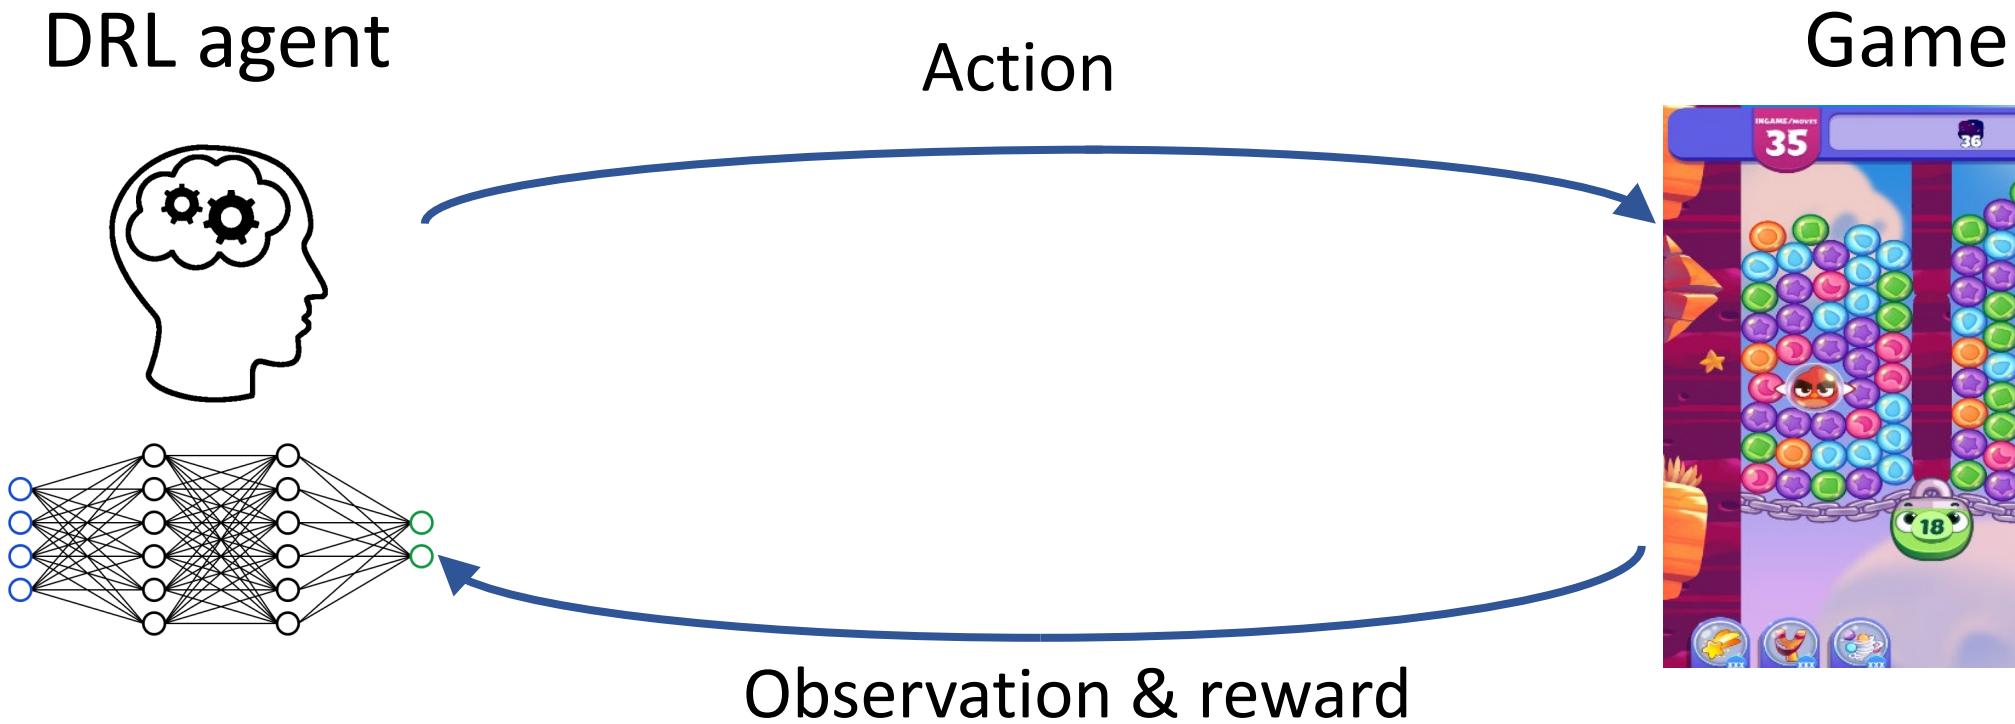

Contribution

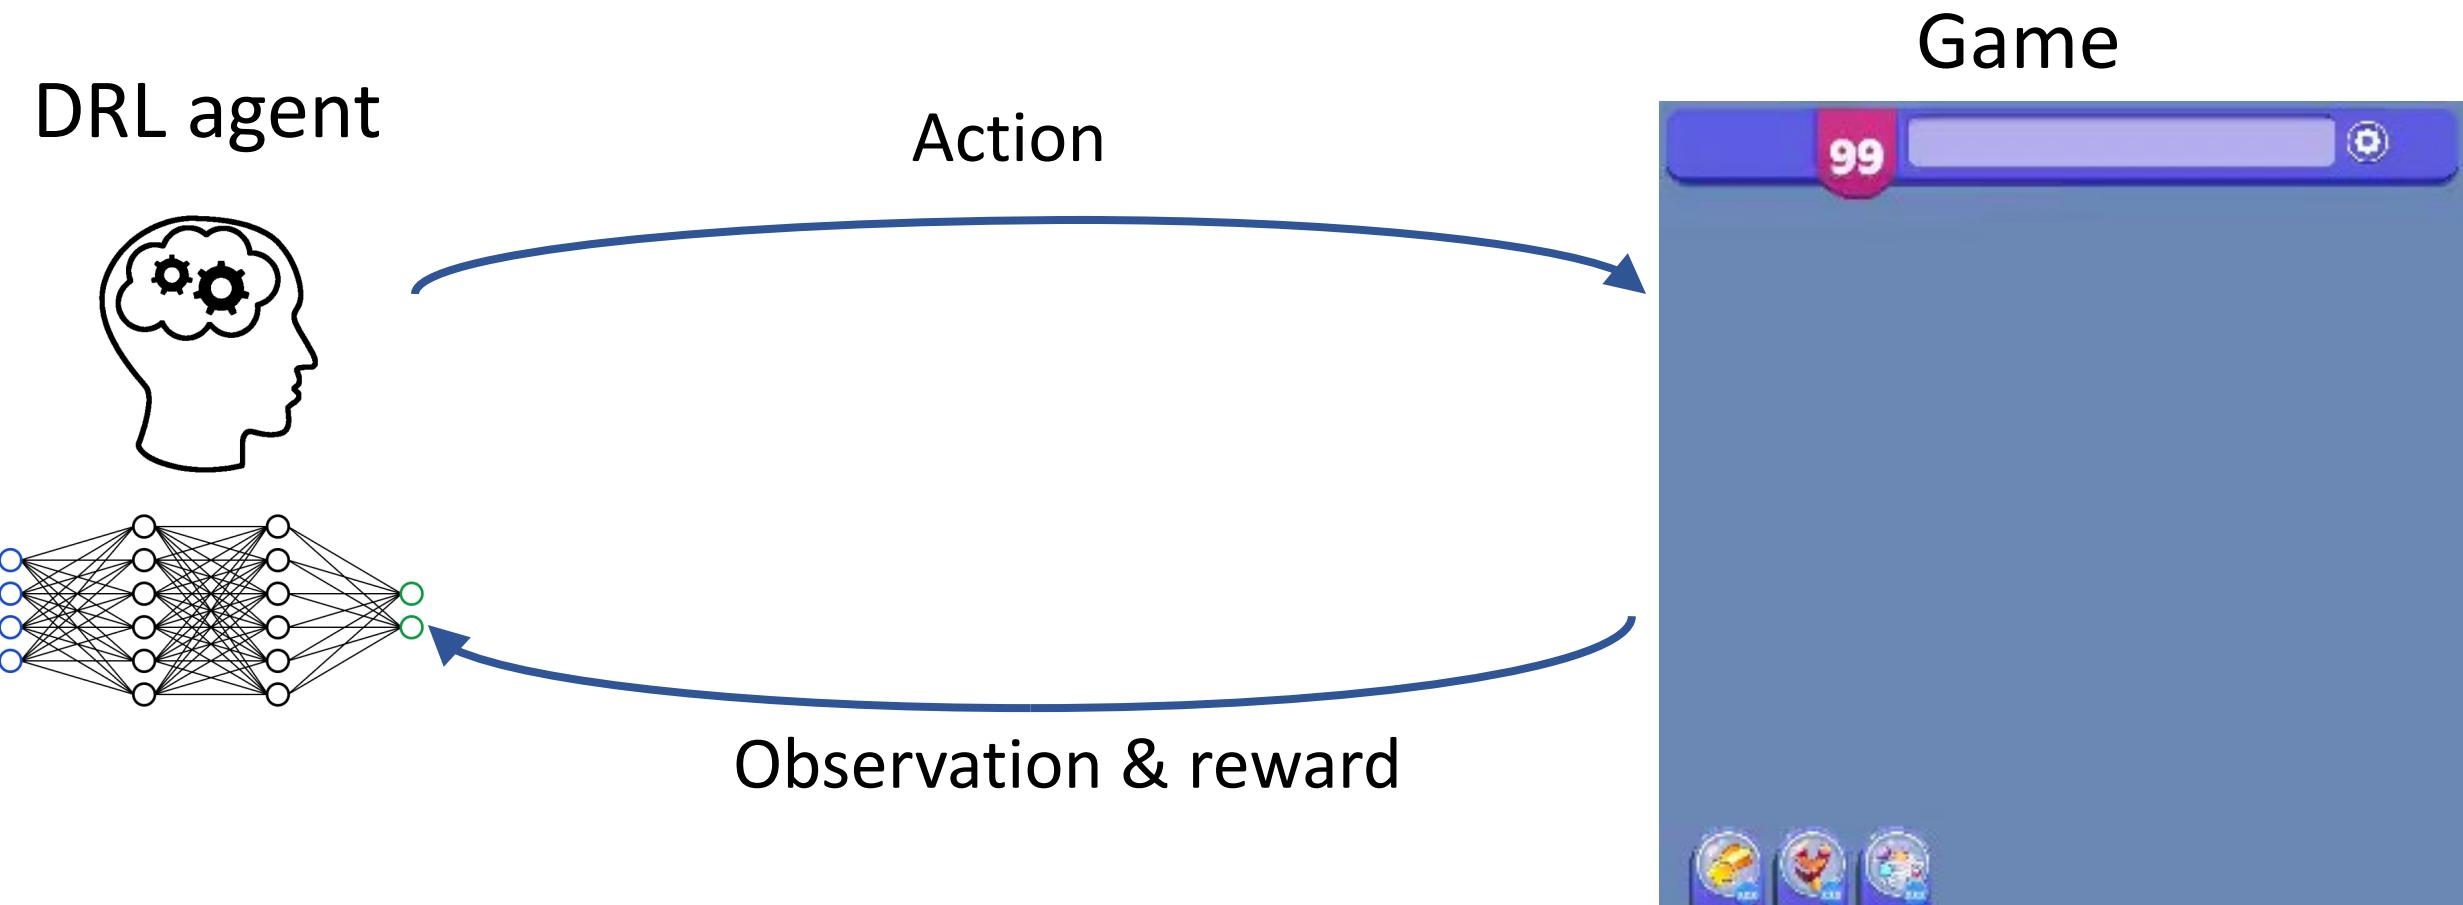

- Model the relation between level pass and churn rates by combining
 1. AI game playing using Deep Reinforcement Learning (DRL)
 2. Simulation of how the player population evolves over the game levels, based on simple computational models of skill, persistence, and boredom
- Human-like data emerges from our simulations

Game-playing AI

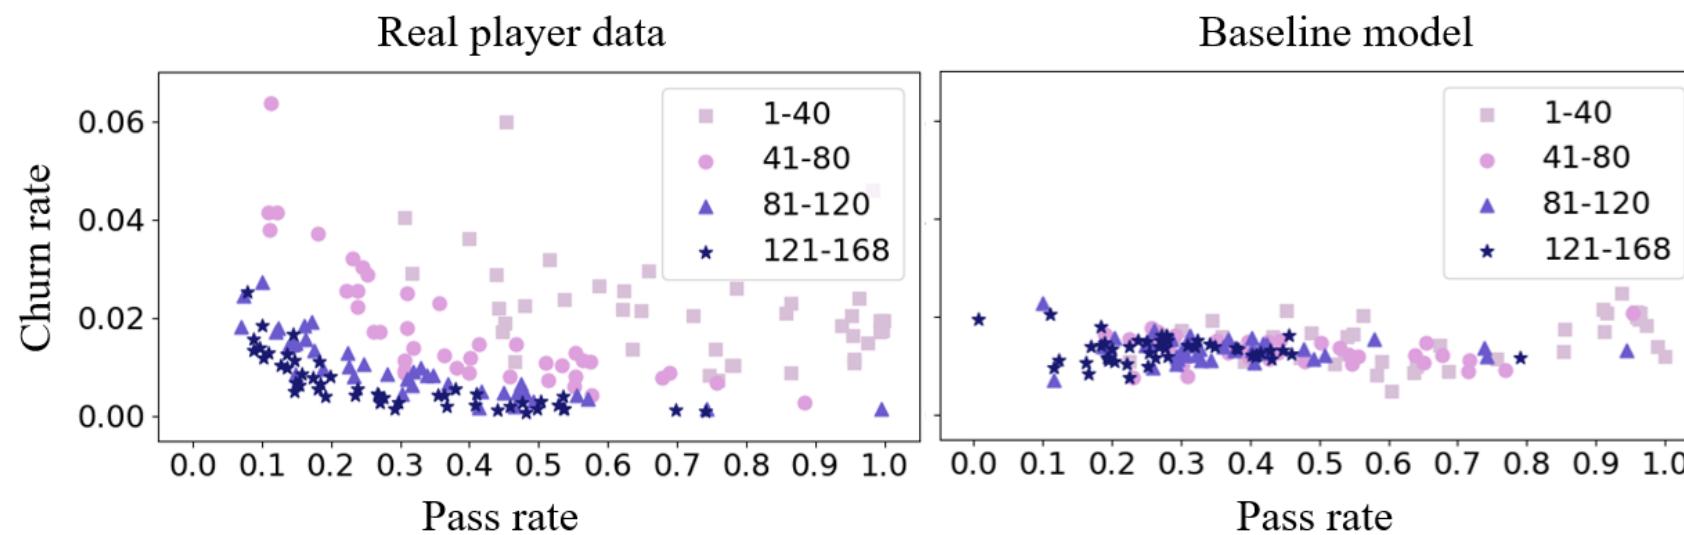

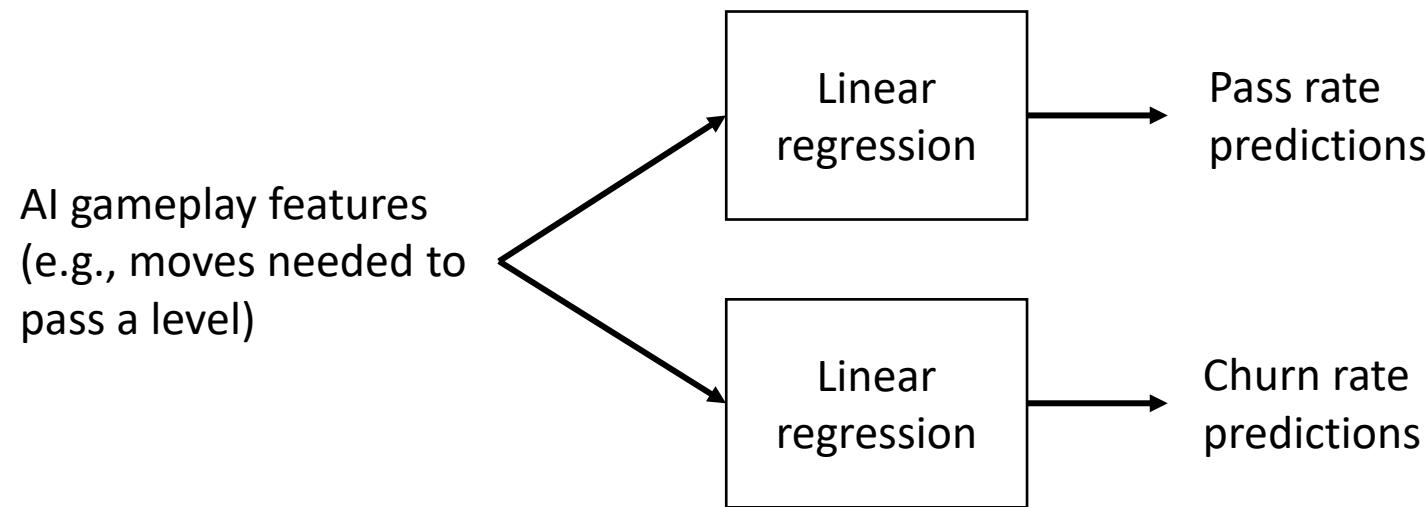

Game-playing AI

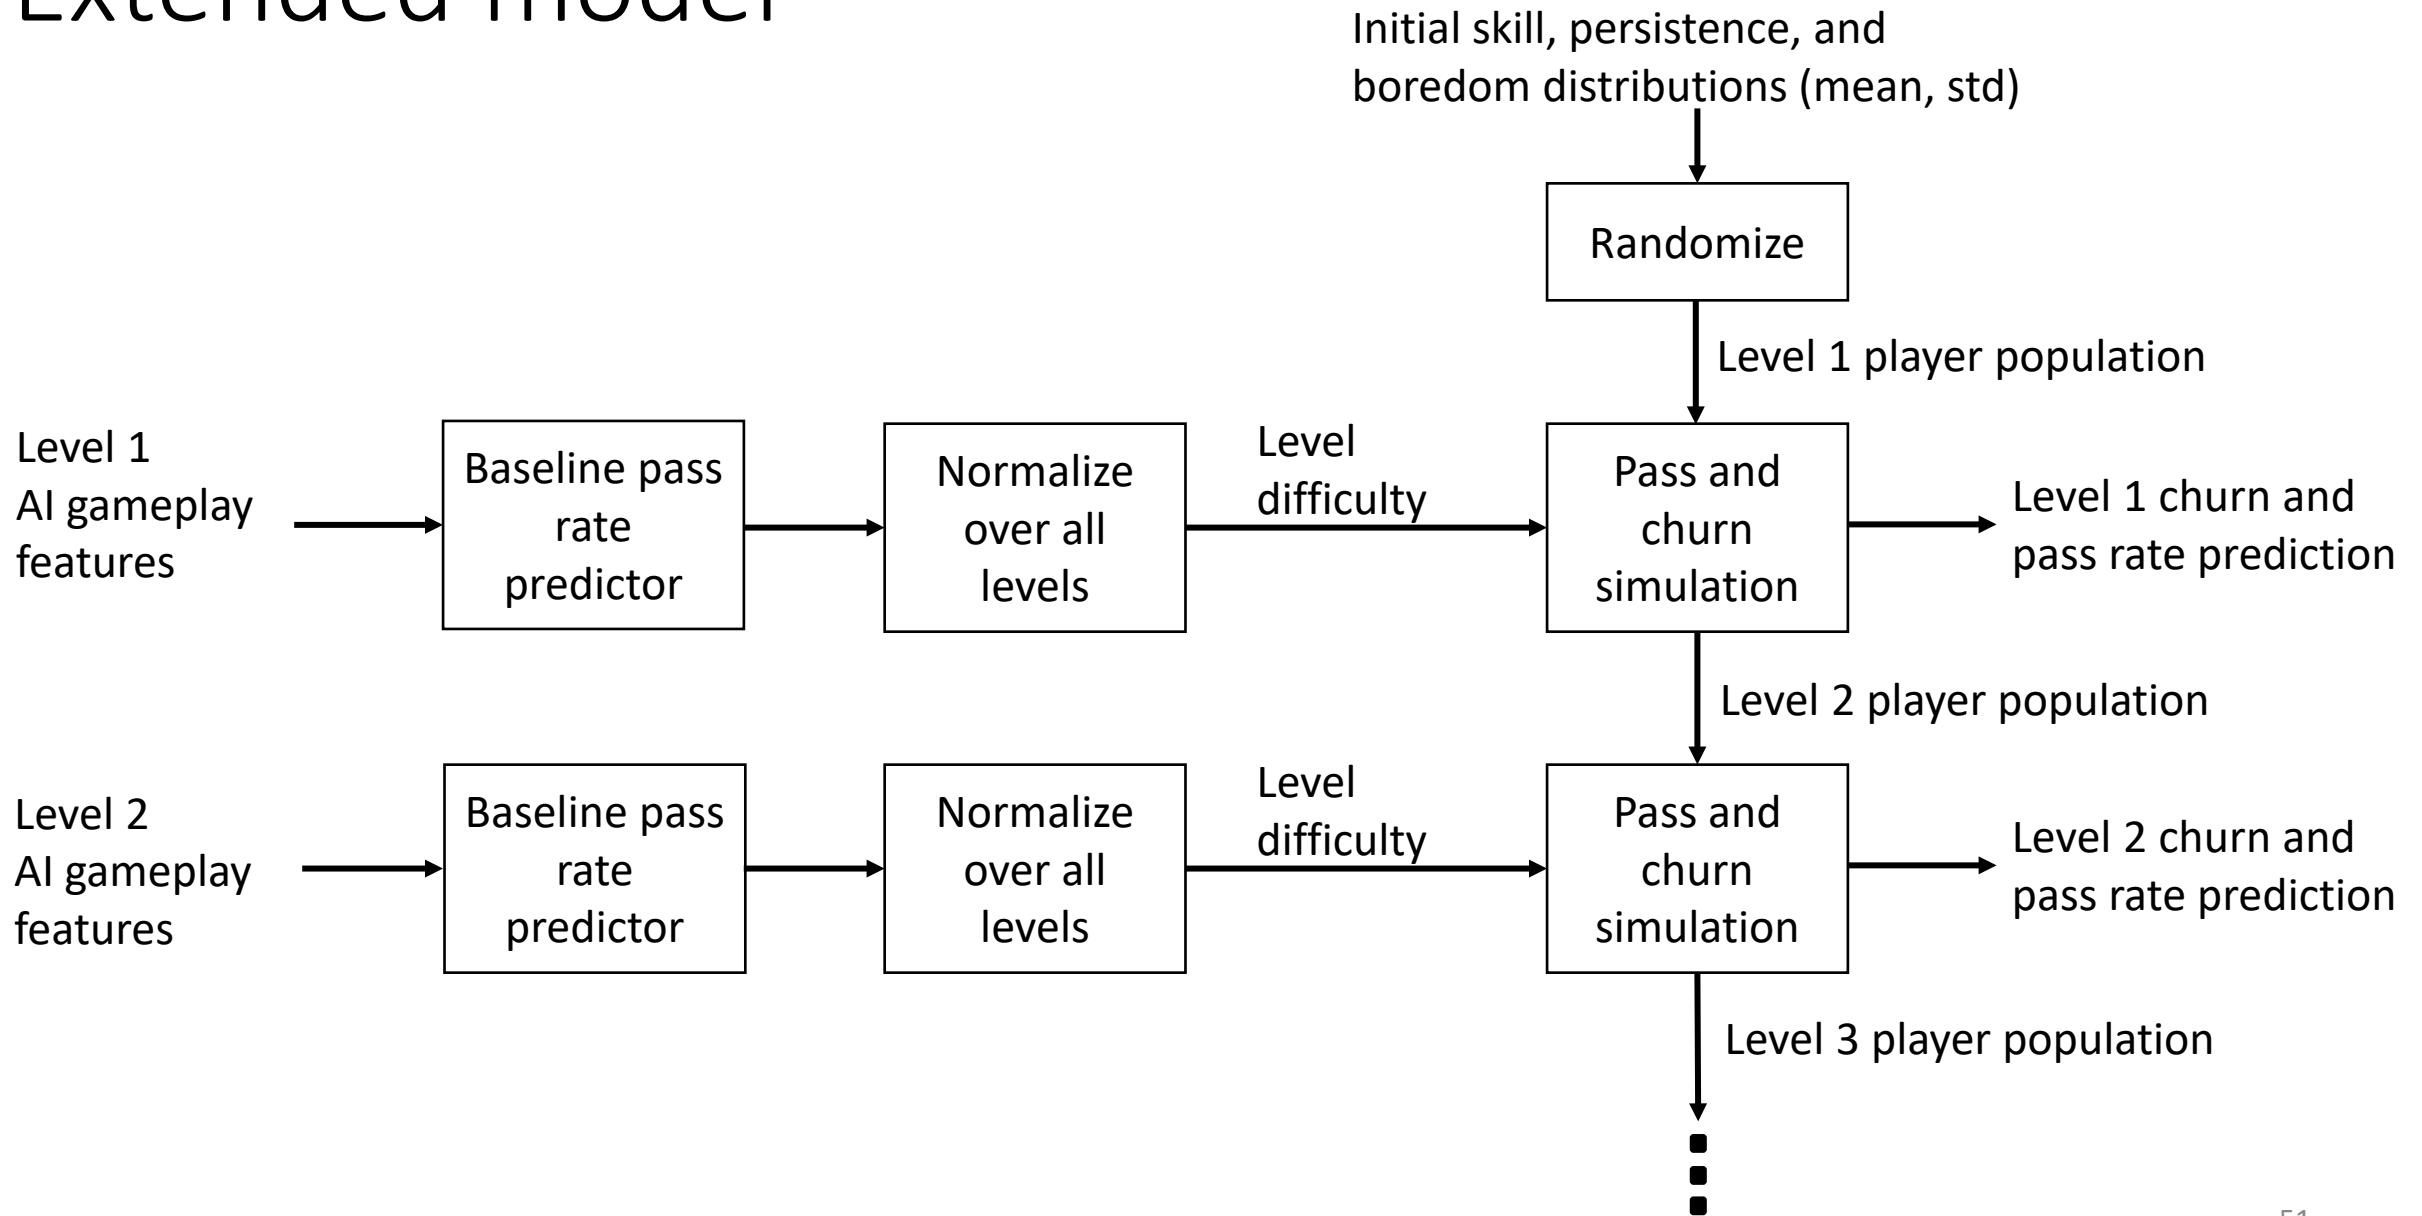

Baseline model

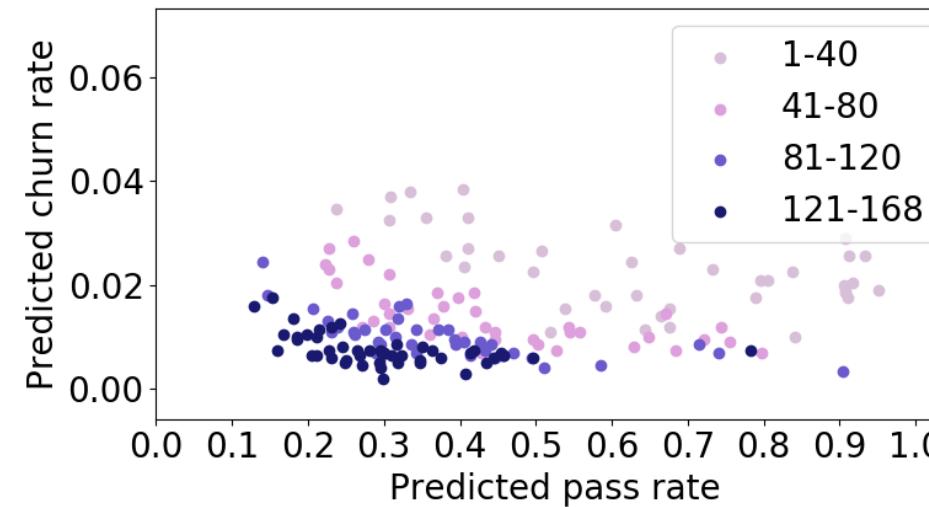

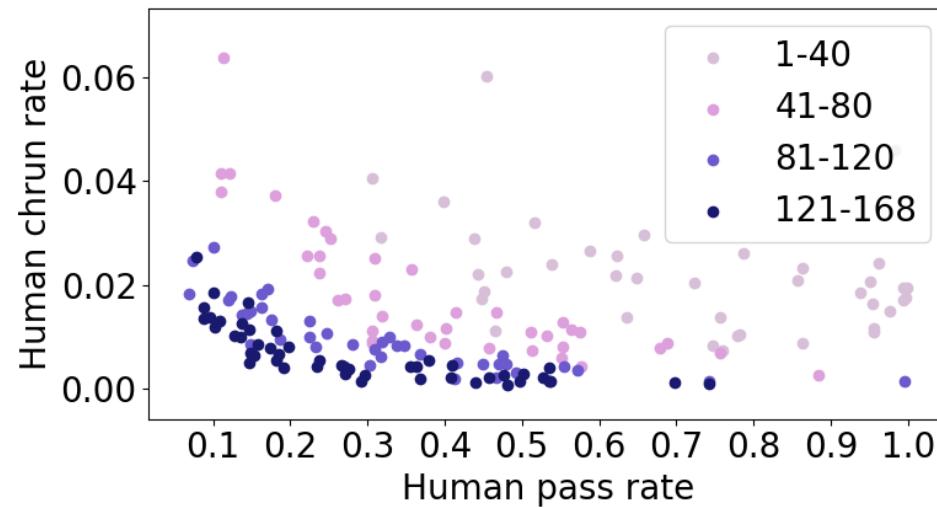

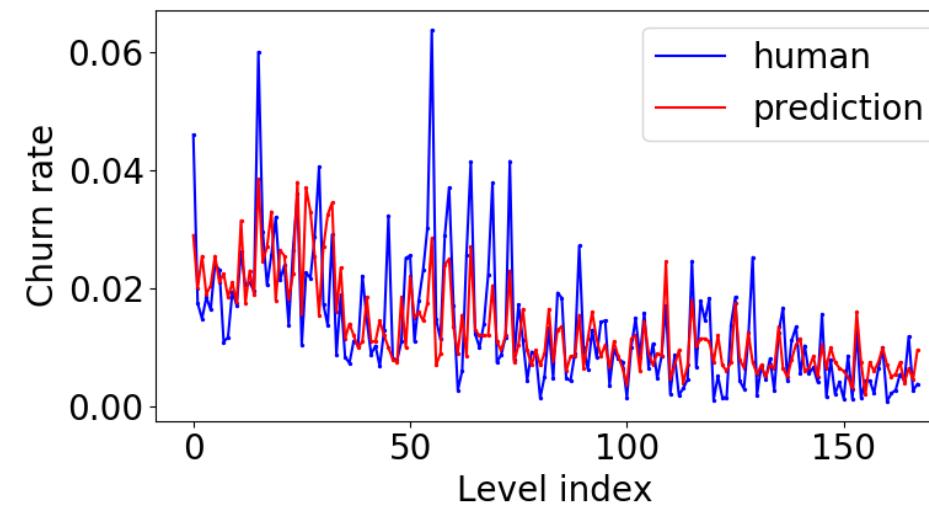

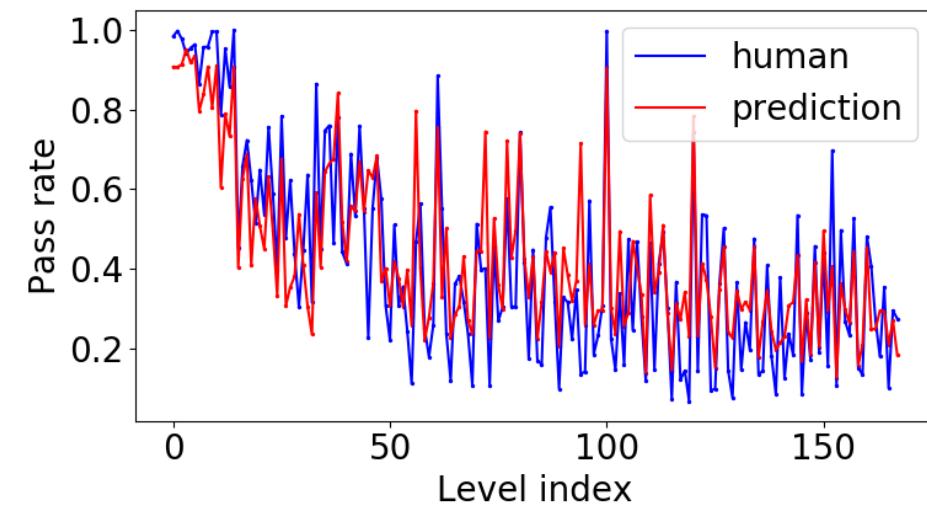

Extended model

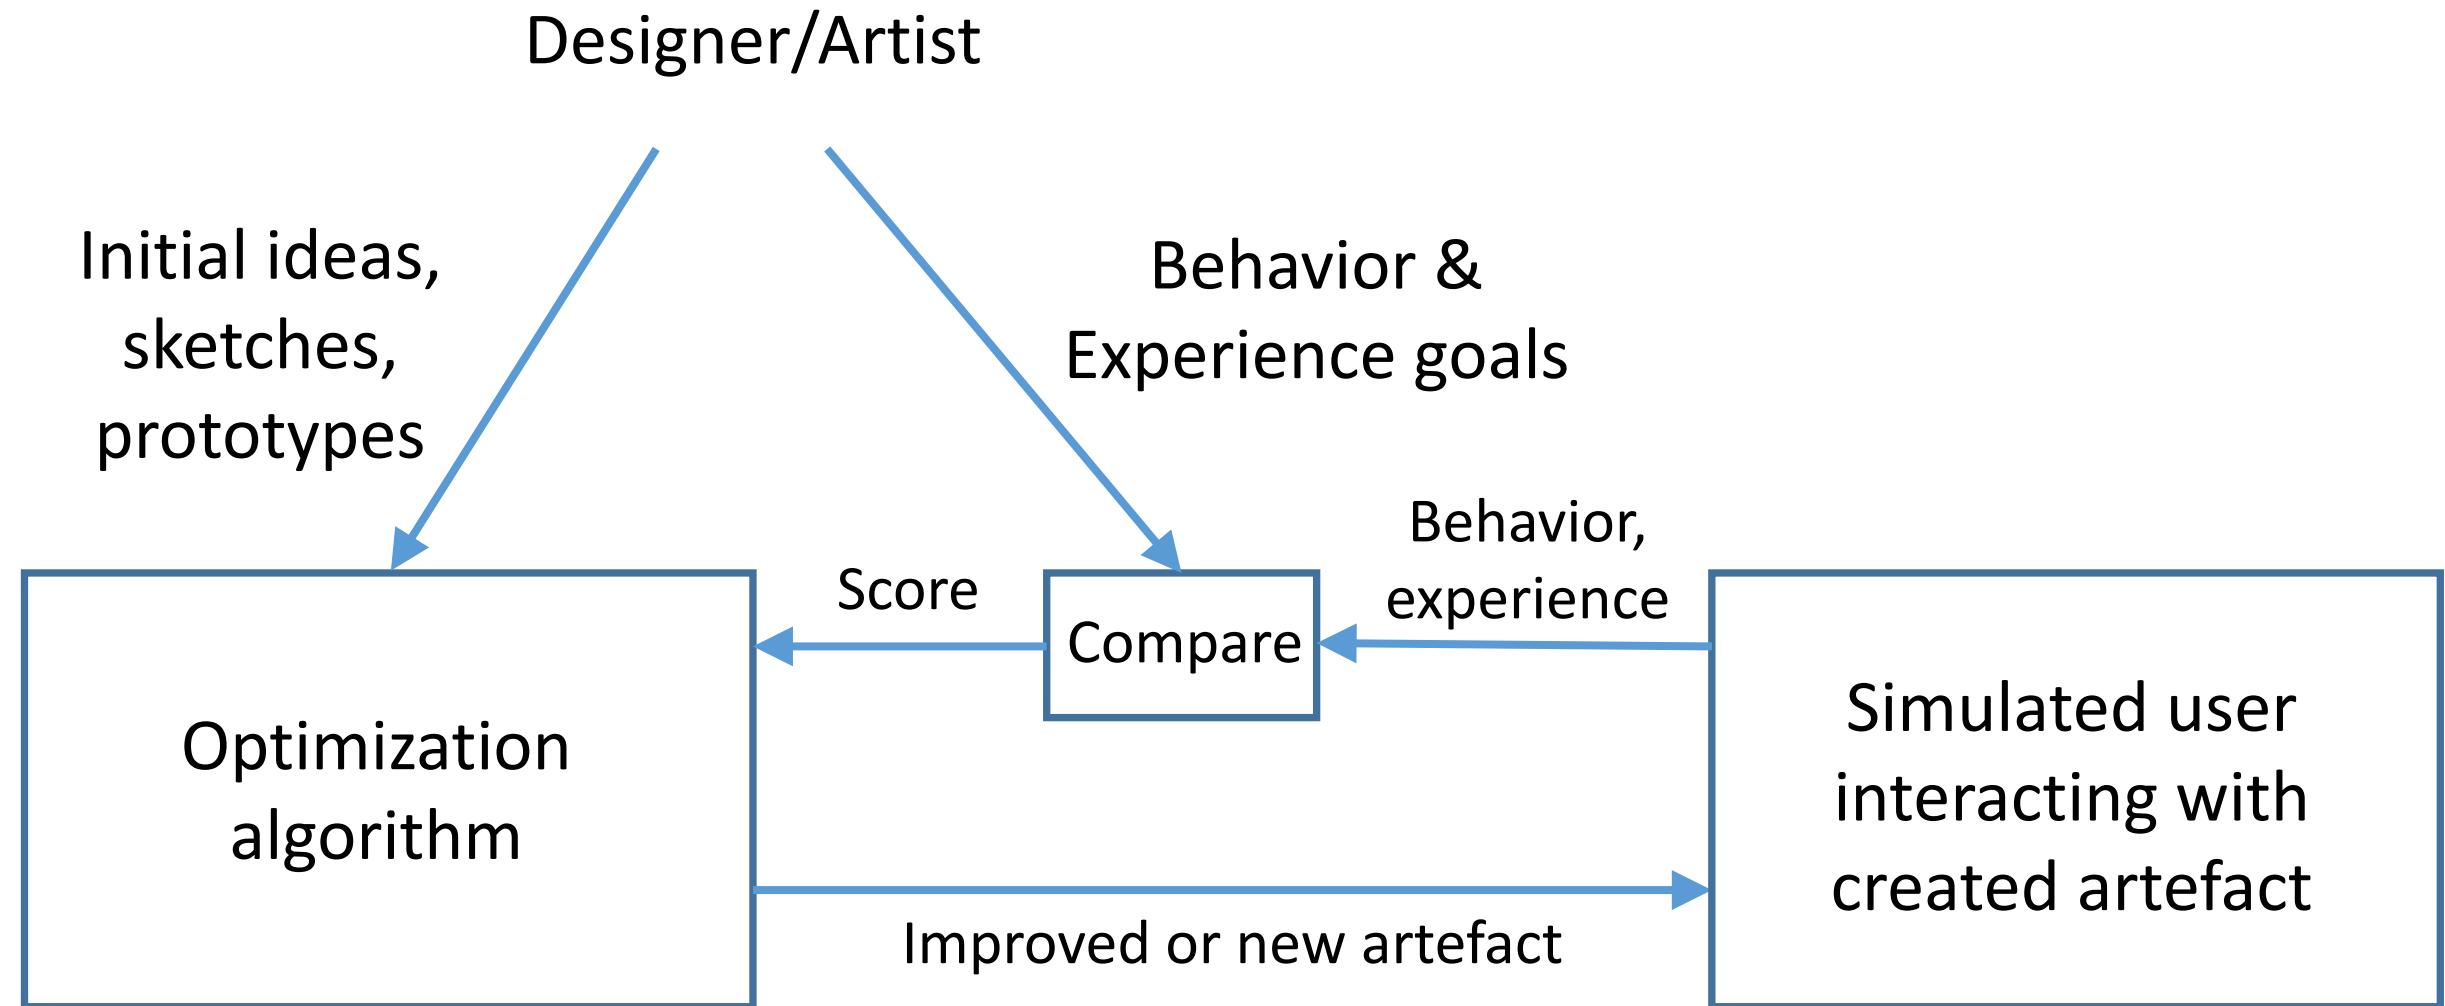

Extended model results

Generalizing beyond games

Recap

- Multiple ways to apply AI & ML for art & design, beyond generating content
- Designers & artists should understand where AI & ML can save work, augment one's strengths, and mitigate one's weaknesses
- This course: Everyone starts from a different level and progresses at their own pace. You can skip ahead with the exercises if they feel trivial. You can also spend more time on something if needed, even if the lectures move ahead.

Legal issues

- Models like ChatGPT and DALL-E are trained on vast databases of copyrighted data, e.g., scraped Internet images and texts
 - That an image or text is freely available doesn't mean it's not protected by copyright
 - Legality of training on copyrighted data without permission is unclear and varies by each country. Multiple lawsuits ongoing.
 - For instance, it has been legal in Germany for researchers => Stability.ai did not train StableDiffusion as a company and instead sponsored German researchers to create an open source model that they build their commercial tools on
 - To be on the safe side, some platforms forbid AI-created content
 - However, some AI providers now promise to handle any legal costs caused by content created using their services

Something to follow

<https://stablediffusionlitigation.com/>

We've filed a lawsuit challenging AI image generators for using artists' work without consent, credit, or compensation.

Because AI needs to be fair & ethical for everyone.

This is Joseph Saveri and Matthew Butterick. In November 2022, we teamed up to file a lawsuit challenging GitHub Copilot, an AI coding assistant built on unprecedented open-source software piracy. In July 2023, we filed lawsuits on behalf of book authors challenging ChatGPT and LLaMA.

In January 2023, on behalf of three wonderful artist plaintiffs — Sarah Andersen, Kelly McKernan, and Karla Ortiz, we filed an initial complaint against Stability AI, DeviantArt, and Midjourney for their use of Stable Diffusion, a 21st-century collage tool that remixes the copyrighted works of millions of artists whose work was used as training data. Lockridge Grindal Nauen P.L.L.P. joined us as co-counsel.

In November 2023, we filed an amended complaint, adding seven new plaintiffs and one new defendant, Runway AI.

Case updates are posted regularly. You can also get updates by email.

An IP and IT lawyer writes about AI art.

Originally in Finnish, but Google translate seems to do a decent job, except the first sentence should be in passive voice ("There's interest in AI art")

https://www-jussikari-fi.translate.goog/ai-taide-ja-tekijanoikeus/?x_tr_sl=fi&x_tr_tl=en&x_tr_hl=en-US&x_tr_pto=wapp

I am interested in AI art. How do I know? About the fact that I have been asked to write about hardly any other topic as often as this one. However, at the beginning it is necessary to put a few disclaimers, because AI art arouses a lot of passions.

First, this write-up basically discusses what *copyright law currently says about AI art*. All jurisprudential analysis and legal interpretation is precisely interpretation, but I try to interpret the law as neutrally as possible. In the language of jurisprudence, one would speak of a *legal* or *legal dogmatic* approach. So it is not my opinion on how things *should be*, but how I see them to *be*.

Secondly, my analysis basically concerns *the law*. The law is the minimum level of social activity and it is possible to expect a higher moral level of activity from people than what the law obliges. So basically, I will not comment on whether artificial intelligence art is in accordance with "artistic ethics", whether it is art at all, or any other similar question.

Thirdly, I will examine the matter specifically from the point of view of a Finnish lawyer. In the USA, the law is considerably different. There, for example *fair use doctrine* is in a significant position in the discussion regarding copyright and also AI art. In Europe, including Finland, fair use is basically not known, but copyright is based on the exclusive rights of the author and the limitations of those rights.

Ethical issues

- Shouldn't we be using AI in a way that increases wellbeing?
- History shows that many technologies have promised better wellbeing, but societal and economic dynamics have resulted in jobs being less satisfying, e.g., monitoring a machine instead of producing something oneself
- There are signs that the same is happening, e.g., game artists pressured into becoming “assistants to the AI” who fix the AI’s mistakes instead of using the AI to automate the tedious parts of their workflow
- Yet unknown how much pressure consumers are willing and able to put on companies.

AaltoMediaAI @aaltomediaai · Jan 11, 2023

...

Optimistic pro-AI people claim AI will create new jobs, but this thread provides yet more evidence that such jobs might not be meaningful or financially feasible. Shouldn't we utilize AI in a way that increases wellbeing on average, instead of just the few in a position of power?

Jason Colavito @JasonColavito · Jan 7, 2023

A client informed me that he will no longer pay me to write content for his website because A.I. can write it for free, but he wants to pay me a fraction of my usual rate to "rewrite it" in different words so it can pass Google's A.I. detection screening.

Our interview study of text-to-image in the Finnish game industry

Views differ depending on role (e.g., manager vs. artist)

<https://arxiv.org/pdf/2302.12601.pdf>

"An Adapt-or-Die Type of Situation": Perception, Adoption, and Use of Text-to-Image-Generation AI by Game Industry Professionals

VEERA VIMPARI, Aalto University, Finland

ANNAKAISA KULTIMA, Aalto University, Finland

PERTTU HÄMÄLÄINEN, Aalto University, Finland

CHRISTIAN GUCKELSBERGER, Aalto University, Finland

Text-to-image generation (TTIG) models, a recent addition to creative AI, can generate images based on a text description. These models have begun to rival the work of professional creatives, and sparked discussions on the future of creative work, loss of jobs, and copyright issues, amongst other important implications. To support the sustainable adoption of TTIG, we must provide rich, reliable and transparent insights into how professionals perceive, adopt and use TTIG. Crucially though, the public debate is shallow, narrow and lacking transparency, while academic work has focused on studying the use of TTIG in a general artist population, but not on the perceptions and attitudes of professionals in a specific industry. In this paper, we contribute a qualitative, exploratory interview study on TTIG in the Finnish videogame industry. Through a Template Analysis on semi-structured interviews with 14 game professionals, we reveal 12 overarching themes, structured into 39 sub-themes on professionals' perception, adoption and use of TTIG in games industry practice. Experiencing (yet another) change of roles and creative processes, our participants' reflections can inform discussions within the industry, be used by policymakers to inform urgently needed legislation, and support researchers in games, HCI and AI to support the sustainable, professional use of TTIG, and foster games as cultural artefacts.

CCS Concepts: • Social and professional topics; • Computing methodologies → Artificial intelligence; • Human-centered computing → Empirical studies in HCI; Field studies; Interactive systems and tools;

Additional Key Words and Phrases: Text-To-Image Generation, Artificial Intelligence, Generative Model, Videogame Industry, Professional Creatives, Sustainability, Attitudes toward Technology, Adoption of Technology, Use of Technology, Interview Study, Thematic Analysis, Field Study
